

VTT CityTune® KPI

With a unique understanding of city needs and decades of experience from indicator projects, we can help you select relevant indicators, set target values and define tailored or localised indicators based on your city's individual needs.

We help you exploit your data in the most powerful way so that it can create new business opportunities, enable cost savings, improve transparency and services.

VTT CityTune® KPI

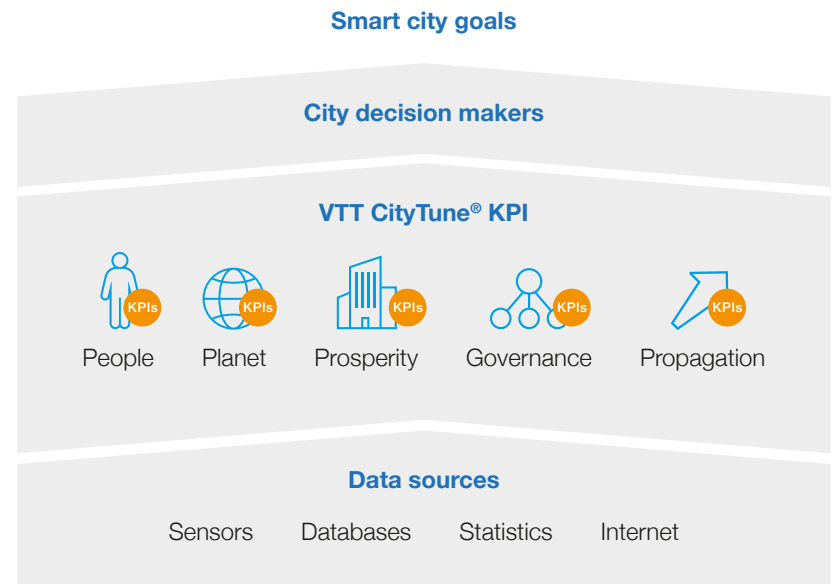

Complex data made easy for informed city decisions

VTT CityTune® KPI is a tool that integrates the exploding amount of smart city data into relevant, easily understandable and useful information for data-based city decision-making. It shows what is essential and still ensures that investments serve your goals by indicating the impacts on people, planet and prosperity.

The tool is based on ETSI-standardised indicators, that have been developed together with 50 cities, after analysing their needs, as well as on 40 existing indicator frameworks. The tool integrates all key smart city areas and shows their sustainability impacts. It can therefore be used in the management of smart city activities, city decision making and project target setting and monitoring.

Data collection, management and reporting activities can be automated and centralised in one easily accessible place. This has proven to result in significant savings as duplicate work and manual tasks are avoided.

Smart city data turned into useful information for city decision-making
